Build: Accordion / FAQ Component

Problem: Build an accordion where clicking a question reveals the answer. Only one item should be open at a time.

What This Tests: Conditional rendering, single-open logic, component composition.

jsx

JSX Copy

```jsx
function Accordion({ items }) {
  const [openIndex, setOpenIndex] = useState(null);

  const toggle = (index) => {
    setOpenIndex(prev => prev === index ? null : index);
  };

  return (
    <div>
      {items.map((item, index) => (
        <div key={index} style={{ borderBottom: '1px solid #eee', padding:
          <button
            onClick={() => toggle(index)}
            style={{ width: '100%', textAlign: 'left', background: 'none',
          >
            {openIndex === index ? '▼' : '▶'} {item.question}
          </button>
          {openIndex === index && (
            <div style={{ padding: '8px 8px 8px 24px', color: '#555' }}>
              {item.answer}
            </div>
          )}
        </div>
      ))}
```

```
// Usage
const faqData = [
  { question: 'What is React?', answer: 'A JavaScript library for building
  { question: 'What is JSX?', answer: 'A syntax extension that looks like
  { question: 'What are hooks?', answer: 'Functions that let you use state
];

<Accordion items={faqData} />
```

Key Concepts: Single-open logic with `openIndex === index ? null : index`, data-driven rendering from an items array, conditional content display.

Extension: Allow multiple items open simultaneously (use a Set instead of a single index).

QUICK CHECK — no marks, just for you.

1. The Accordion keeps a single piece of state, openIndex, instead of an isOpen boolean on every item. What does this state shape guarantee?

- ○ Every item re-renders only when its own answer changes
- ○ The item list can never be reordered once rendered
- ○ React batches the toggle updates so clicks never drop
- ○ At most one item can be expanded, because a single index can only point at one item

Check answer

2. In the Accordion, when an item is not the open one, what is true of its answer markup?

- ○ It is rendered but hidden with display: none until the item is clicked

It is rendered into a portal outside the accordion until needed

It is rendered with zero height and animated open on click

Check answer

3. You want to extend the Accordion so several items can stay expanded at once. What change does the lesson suggest?

Give each item its own Accordion component instance

Replace the single open index with a Set of open indices

Render every answer and toggle a CSS class per item

Move openIndex out of state and into a ref

Check answer

Previous
Build: Star Rating Component

Next
Build: Modal / Dialog Component
